1. Problem Statement & Objectives

1.1 Problem Statement

Modern software applications require reliable, scalable, and automated deployment infrastructure to ensure continuous availability and seamless updates. The Multi-Agent Manufacturing System, built with Python, Streamlit, and CrewAI, needed a production-grade deployment pipeline that could containerize the application, manage it on a cloud Kubernetes cluster, and deliver new versions without any service interruption.

1.2 Project Objectives

- Containerize the Multi-Agent Manufacturing System using Docker with a clean Linux-compatible build strategy
- Deploy the application on AWS EKS Kubernetes cluster in the Mumbai region
- Implement zero-downtime Rolling Updates ensuring the app remains available during every deployment
- Build a fully automated GitHub Actions CI/CD pipeline that deploys on every git push with no manual steps
- Manage all credentials securely using GitHub Secrets with no sensitive data stored in code or images

1.3 Scope of the Project

This project covers the complete DevOps infrastructure for deploying the Multi-Agent Manufacturing System. It includes Docker containerization, Kubernetes deployment and service configuration, AWS EKS cluster setup, CI/CD pipeline implementation using GitHub Actions, AWS Load Balancer configuration for public access, and security through runtime secret management. The project does not cover the internal AI logic of the CrewAI agents or the business logic of the manufacturing domain those are addressed in the Multi-agent-system repository.

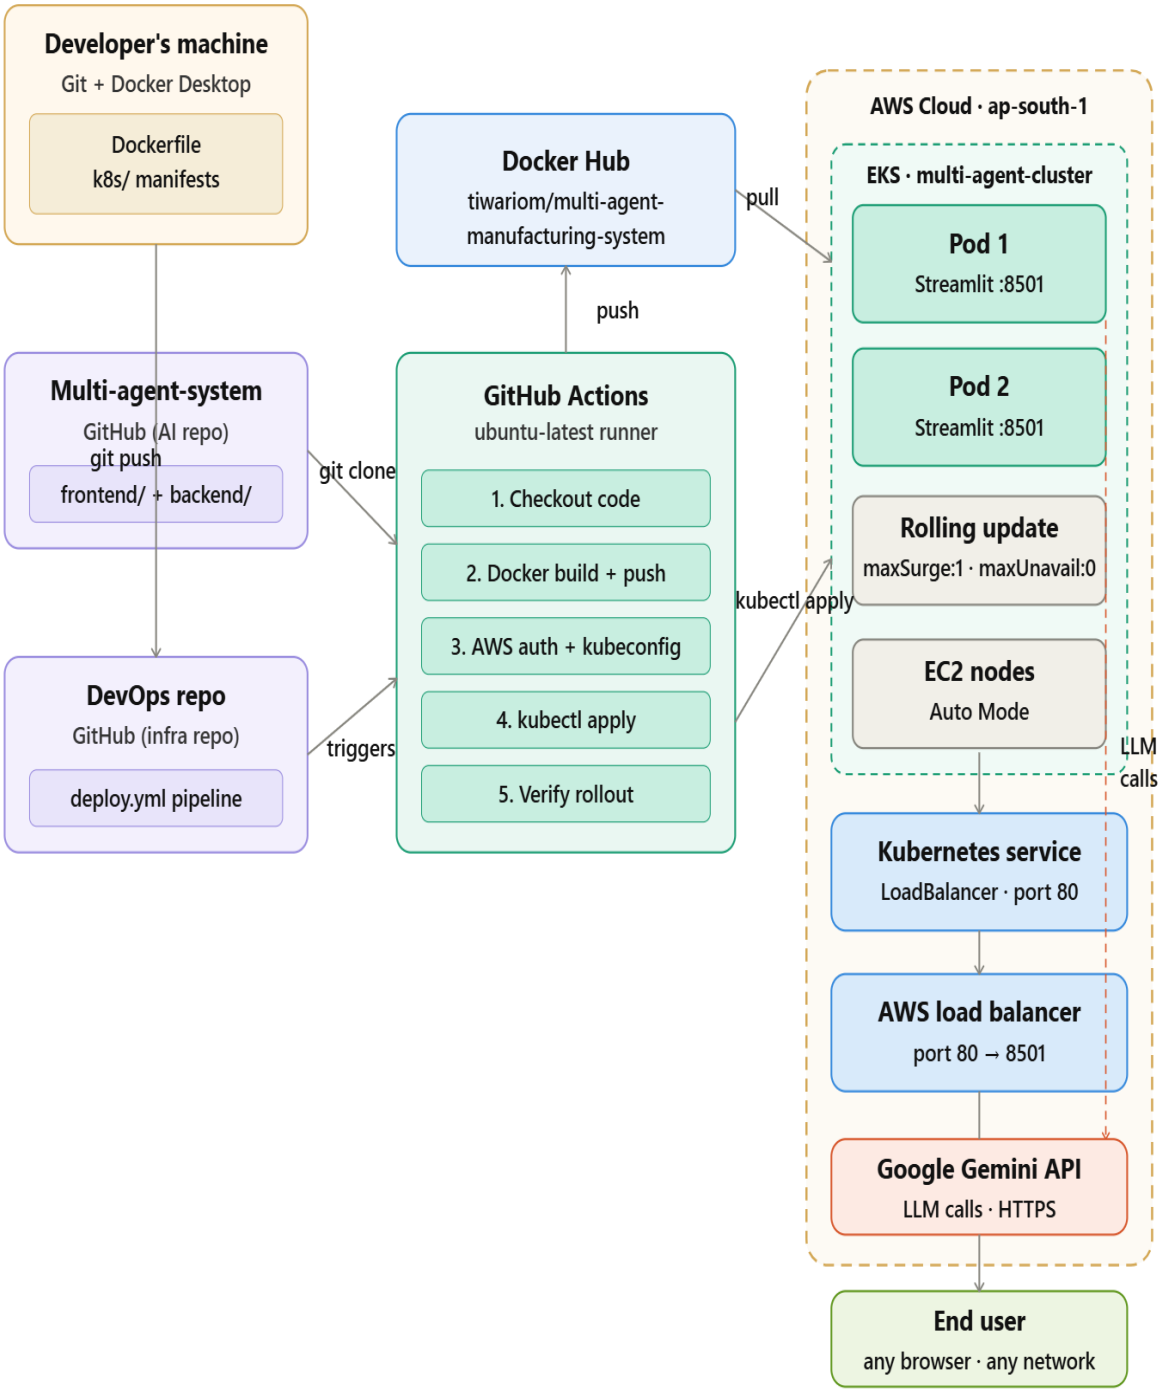
2.Proposed Solution

2.1 Key Features

- Automated CI/CD pipeline triggered on every git push to main branch
- Zero-downtime Rolling Updates using Kubernetes deployment strategy
- Docker containerization with GitHub-based build no local builds needed
- Two-repository architecture DevOps repo contains zero application code
- Deployed on AWS EKS with auto-provisioned nodes and public Load Balancer

- Health-check-driven deployments using Streamlit's built-in /_stcore/health endpoint
- All credentials managed via GitHub Secrets nothing stored in code or images

2.2 Overall Architecture / Workflow



2.3 Tools & Technologies Used

Category	Tool / Technology
Containerization	Docker, Docker Hub
Orchestration	Kubernetes, AWS EKS
CI/CD	GitHub Actions
Cloud	AWS EKS, AWS EC2, AWS Load Balancer, AWS VPC
Infrastructure	AWS IAM, AWS Auto Mode
Application	Python, Streamlit, CrewAI, Google Gemini LLM
Version Control	Git, GitHub

3. Results & Output

3.1 Screenshots / Outputs

GitHub Actions Pipeline- 9 Stages

Stage	Status
Checkout repository	Passed
Login to Docker Hub	Passed
Build Docker image	Passed
Push Docker image	Passed
Configure AWS credentials	Passed
Update kubeconfig for EKS	Passed
Deploy to Kubernetes	Passed
Verify deployment rollout	Passed
Show running pods	Passed

3.3 Key Outcomes

- Application successfully containerized and deployed on AWS EKS in Mumbai region
- Fully automated CI/CD pipeline operational zero manual deployment steps required
- Zero-downtime rolling updates verified app remained accessible throughout pod replacement
- Docker image publicly available on Docker Hub
- Application accessible globally via AWS Load Balancer public URL
- Total AWS infrastructure cost kept within $1–2 using free credits by deleting cluster when not in use

4. Conclusion

This project successfully demonstrates a complete production-grade DevOps implementation for deploying a Python Streamlit application onto AWS EKS. Starting from a locally running multi-agent AI system, we built a fully automated deployment pipeline that containerizes the application using Docker, orchestrates it with Kubernetes, and delivers it to the cloud through GitHub Actions CI/CD all triggered by a single git push.

The key learning from this project is the practical understanding of how containerization, Kubernetes orchestration, cloud infrastructure, and CI/CD pipelines work together as a

unified system. The two-repository architecture keeping application code and DevOps infrastructure completely separate proved to be a clean and maintainable approach. The health-check-driven rolling update strategy demonstrated how production systems achieve zero downtime in real-world deployments.

5. Future Scope & Enhancements

- **HTTPS support-** configure SSL certificate via AWS Certificate Manager with a custom domain for secure connections
- **Horizontal Pod Autoscaler-** automatically scale pod count based on CPU and memory usage during peak traffic
- **Persistent Storage-** integrate AWS S3 or EFS to persist agent run artifacts across pod restarts
- **Monitoring and Alerting-** integrate Prometheus and Grafana for real-time pod metrics, resource usage dashboards, and deployment alerts
- **Multi-environment pipeline-** add staging and production environments with separate Kubernetes namespaces and approval gates
- **Helm Charts-** package Kubernetes manifests as Helm charts for easier versioning and environment-specific configuration management
- **Private container registry-** migrate from Docker Hub to AWS ECR for tighter security and faster image pulls within AWS infrastructure
